
1667.00-1672.00 nm, 316 exposures: every step, in order, in the STAR'S REST FRAME
vertical structure belongs to the star; anything slanted does not
1. the high pass: ln(f) minus a Savitzky-Golay of ln(f)
2. the reconstruction: 1 star + 3 observer, and the star's spectrum per parity
3. minus the OBSERVER block: what a corrected file holds scatter 0.0455
4. minus the STAR block: everything that is not the star scatter 0.0235
5. minus everything: what nobody explained scatter 0.0191
6. what the correction divides out, the observer block and its mean scatter 0.0138
ln(f/savgol f)
residual, ln f
exposures, ordered by BERV
5 of those rows in FLUX, spread over BERV -19.0 to +18.8 km/s
flux / its own median
before
observer block removed
wavelength (nm), star frame
